

Rajeev Atla

~~Settlers of Catan~~ A board game is played on a hexagonal grid of 19 tiles. A 'traveler' token starts on the center tile. Each turn a die is rolled to determine what neighboring tile the traveler moves to (all six directions equally likely). The turn that the traveler leaves the board, the game ends. What is the expected number of turns of the game?

A diagram of a hexagonal lattice structure. The central cell is labeled 0. Surrounding it are cells 1 through 18, arranged in a hexagonal pattern. The vertices of the lattice are marked with green dots and numbered 19 through 37. The numbering of the vertices follows a specific pattern, starting from the top and moving clockwise around the perimeter of the lattice.

$$\mathbb{E}(N) = \sum N \mathbb{P}(N)$$

[illegible]

In order to get the expected number of steps, we find t_0 , where

$$t = N\mathbf{1}$$

Here, $\mathbf{1}$ is a vector whose entries are all 1.

[illegible]

Finally, we see that $t_0 = \boxed{\frac{213}{29} \approx 7.345}$
